

Product Prototype Project

Instructions & Submission Guide

29 September: Account setup (Bloom)

Please go to <https://bloom.diy/> and set up an account using your **ETH student email address** by 29 September.

2 October: Introduction to Bloom

On **2 October**, [David Oort Alonso](#), co-founder and Chief Excitement Officer of Bloom, will join us to:

- introduce the Bloom platform;
- explain how to use it effectively;
- share practical product-building tips; and
- explain credit consumption and how to use your available credits efficiently.

Each student will have **2,000 Bloom credits** available for the course. You are welcome to use additional credits, but any usage beyond the **2,000 course-provided credits** will be at your own expense.

You can already start thinking about the **product idea** you would like to work on.

3 October: Build and Experiment

As discussed in class, the goal is to build a **simple prototype of a product**.

On **3 October**, you will have approximately **2 hours** to experiment with Bloom. The aim is to:

1. build a prototype of your product;
2. test your idea; and
3. if time allows, iterate on it once or twice.

Errors, bugs, unexpected behaviour, and the occasional “why on earth is it doing that?” moment are all part of the process. The goal is not to produce something perfect, but to learn by building, testing, and improving.

Students attending the class on **3 October** will also **present what they have built to the class**.

You are also welcome to use other development tools, such as **Claude Code, Cursor, or similar tools**, if you prefer. However, please note that **course-provided credits are only available for Bloom**; we cannot provide credits or subscriptions for other tools.

10 October: Final submission (Prototype Development Reflection)

Every student must complete and submit the Prototype Development Reflection form by **10 October**.

The purpose of the reflection is to capture what you built, what you learned during the prototyping process, and your experience with Bloom or any alternative tool you chose to use. Please answer all questions briefly but thoughtfully.

Both your reflection and your presentation (in class or by video) will be graded. If you are **present in class on 3 October**, you will give a short **2–3 minute presentation** of your prototype in class. You can fill out the form afterwards.

If you are **not present in class on 3 October**, you must instead submit a link at the end of the form to a **2–3 minute video recording** presenting your prototype. Please make sure the link can be opened directly without requesting access, and test it in a private/incognito browser window before submitting.

The deadline for the reflection form is 10 October for all students.

Access to the form: [Prototype Development Reflection – Fill out form](#)

What to do before 3 October

- Set up your Bloom account using your **ETH student email address by 29 September**. If you miss this deadline, Bloom will not be able to assign the course credits to your account.
- **On 2 October**: check that your **2,000 Bloom credits** have been added to your account. If not, inform Kornelia Papp **by 19:00 on 2 October**.
- Start thinking about a **simple product idea** you would like to build. Keep the scope manageable: the objective is to create and iterate on a **prototype**, not to build a finished product.
